

## Quick Start :

[github.com/wyolum/ClockIoT/wiki/Quick-Start](https://github.com/wyolum/ClockIoT/wiki/Quick-Start)

### First turn On (one time WiFi setup)

- By default, ClockIoT expects to be in range of a WiFi hotspot. When it boots for the first time, it will create a temporary WiFi hotspot called "KLOK" & display "KLOK" using letters on the faceplate as pixels.
- Using a computer or phone, find & join "KLOK" network.
- This will bring you to the welcome screen (or enter 192.168.4.1 in a browser).
- Enter your WiFi credentials.
- ClockIoT will store them and reset.
- Once on the internet, ClockIoT will look up the UTC (Zulu) time using NTP, and your timezone from wyolum.com courtesy of ipapi.co. And you are all set!!
- Visit <http://www.wyolum.com/clockiot/UI/> to control ClockIoT.
